

PKTMON Quick Reference

Basic Syntax

pktmon filter list	List all packet filters	pktmon status	Query Packet Monitor status
pktmon filter add	Add a packet file	pktmon counters	List all counters
pktmon filter remove	Remove a packet filter	pktmon reset	Reset all counters to zero
pktmon start	Start capturing to file	pktmon etl2pcap	Covert ETL file format to pcapng
pktmon stop	Stop capturing to file	pktmon unload	Unload pktmon driver

Filter Syntax

```
pktmon filter add [<name>] [-m mac [mac2]] [-v vlan] [-d { IPv4 | IPv6 | number }]
                  [-t { TCP [flags...] | UDP | ICMP | ICMPv6 | number }]
                  [-i ip [ip2]] [-p port [port2]] [-e [encapsulation]]
```

Packets must match ALL conditions from at least ONE filter to be logged

pktmon filter add -p 53	Add port 53 (TCP and UDP, IPv4 and IPv6) to filter list
pktmon filter add -t TCP -p 22	Add only TCP port 22 to filter list
pktmon filter add -p 123, 123	Only packets with src port 123 and dst port 123
pktmon filter add -i 172.32.1.1	Only packets to/from IP 172.31.1.1
pktmon filter add -i 172.32.1.1, 8.8.8.8	Only packets between these two IPs
pktmon filter add -m ba:ad:be:ef:00:01	Only packets with MAC BA:AD:BE:EF:00:01
pktmon filter add -v 200	Only packets with VLAN 200 in 802.1Q header
pktmon filter add -e <VXLAN GRE NVGRE...>	Only packets with specific encapsulation
pktmon filter list	List all filters
pktmon filter remove	Remove all filters

Capture Syntax

```
pktmon start [-c [--comp { all | nics | [ids...] } ] [--pkt-size { 0 | size } ]
              [--type { all | flow | drop } ]] [-f file-name] [-s file-size]
              [-r] [-m { circular | multi-file | memory | real-time } ]
```

pktmon start -c	Log ALL network interfaces to PktMon.etl
pktmon comp list	Get a list of network interface IDs
pktmon start -c --comp 13	Capture from only network interface ID 13
pktmon start -c --pkt-size 0	Capture FULL packet data (default 128 bytes, 0 == FULL)
pktmon start -c --type drop	Only log dropped packets
pktmon start -c -f output.etl	Specify non-default filename for ETL log
pktmon start -c -s 1024	Set max size (MB) of output file (512 MB default)
pktmon start -c -r	When the ETL file is full, overwrite beginning
pktmon start -c -m multi-file	When the ETL file is full, create a new file (default is circular)
pktmon stop	Stop capture packets: output in pktmon.etl

Output Syntax

pktmon etl2txt <etl file> -o <txt file>	Convert ETL file to TXT
pktmon etl2pcap <etl file> -o <pcap file>	Convert ETL file to PCAPNG (wireshark) format
pktmon etl2pcap <etl file> -o <pcap file> -d	“-d” == Only convert DROPPED packets
